Re: Application # 09/918,523

The Patent cited by Li (5,744,790) does not have any relevance to this application, as Li describes a bar code reader in which a laser scans a bar code and a reflection of it is seen on a detector. Even though it contains a laser and a detector, which could be a photocell or an array of photocells, it is completely different than the present invention. In particular, the present invention has a display, which contains a light sensing region, a light emitting region and has an electric field across it. When a laser hits each picture element it senses the light and reemits the light for the user to view.

Thus, both of these inventions are not related to each other. I am faxing you the response to your last office action to meet the deadline, and the original will be sent by courier.

Sincerely

  
Raja Tuli  
Inventor
